## Investigating the Law of Sines

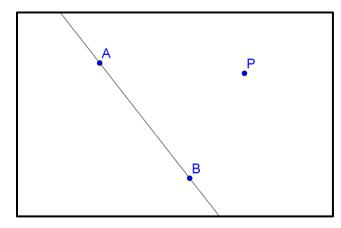

In this project, you will investigate one part of using the Law of Sines. In particular, you will discover the method of determining how many triangles can be formed from a particular set of data.

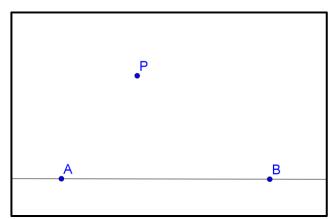

Background Information:

From geometry, we have the following theorem:

For point P not on line AB, the shortest distance from P to AB is the segment that is \_\_\_\_\_\_ to the line and passes through P.

1: Find the segment that gives the shortest distance from P to AB for each of these figures.

On the GeoGebra Module:

How to use the GeoGebra Module:

The scenario is set. You are given a fixed length b = 6 and angle  $\alpha = 50^{\circ}$ . The angle  $\alpha$  is with reference to a fixed ray *AD*. Point *C* is the point formed that is 6 units away with the angle of 50°. The segment across from vertex *A* is *a*. The angle that is formed at point *C* is called  $\gamma$ . You are in control of *a* and  $\gamma$  via the sliders at the top of the page. As you move those sliders, point *B* will move around along with the segment *BC*. Your goal is to form triangles with vertices *A*, *B*, and *C* and then to described those triangles.

Complete the following objectives and questions. Round all decimals to the tenth's place.

2. Find the shortest distance *a* from point *C* to the ray *AD* by adjusting the sliders for *a* and  $\gamma$ .

The shortest distance is \_\_\_\_\_\_.

- 3. When the shortest distance from point *C* to ray *AD* is formed, what is the measure of  $\angle ABC$ ? \_\_\_\_\_\_ And what is the measure of  $\gamma$ ? \_\_\_\_\_\_ What type of triangle is  $\triangle ABC$ ? \_\_\_\_\_\_
- 4. Compute the value of h = 6 sin 50° in your calculator. How does this compare with your value of a above?
  Why do you believe the variable for this quantity is named h? \_\_\_\_\_\_

5. By changing the values of *a* and  $\gamma$ , determine if the given lengths of *a* can be used to form no triangles, one triangle, or two triangles with *b* = 6 and  $\alpha$  = 50°. For multiple triangles, list all possibilities.

а	Number of triangles	С	γ	Describe triangle (scalene, isosceles, equilateral, acute, right, obtuse) [multiple answers]

Create your own:				

## Conclusions

For b = 6 and  $\alpha = 50^{\circ}$ ,....

6. No triangles will be formed if *a* < \_\_\_\_\_

7. If \_\_\_\_\_\_  $\leq a <$  \_\_\_\_\_\_, two triangles will be formed.

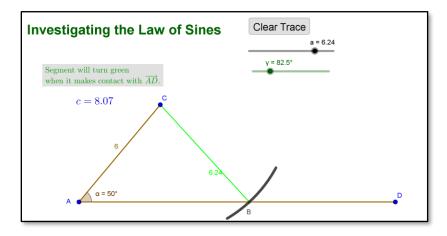

8. If  $a \ge$ \_\_\_\_\_, exactly one triangle will be formed.

For any given *b* and  $\alpha$ , answer these same questions in general (in terms of *b* and  $\alpha$ )

9. No triangles will be formed if *a* < \_\_\_\_\_

10. If \_\_\_\_\_\_  $\leq a <$  \_\_\_\_\_\_, two triangles will be formed.

11. If  $a \ge$ \_\_\_\_\_, exactly one triangle will be formed.

Project Due Date: \_\_\_\_\_

Project is due at the beginning of class. You may turn in the project up to two days late. There will be a 20 point late penalty for each day or portion thereof it is late.
