

First of all, Calculus II was NOT an easy class. It was defying, complex and I think that's why I wanted to have it in the first place. I loved Calculus I and I wanted to continue learning more about it. I didn't know it was going to be this hard and I didn't expect to have that much trouble. But, during the semester, the various activities and quizzes that we had, helped me to keep practicing and in this course I really think practice makes perfect. In the making of this portfolio, I felt lazy to go back to earlier topics and it came to my surprise that I have gotten better. Everything comes to me easier and faster than before and that is a very clear proof of progress. What I think helped me the most, was the time that the teacher took in the class to stop and explain things, no matter how many times. Also, the hard level of some activities helped me to solve more difficult problems than the ones I'm used to, to have a better efficiency during quizzes. This semester was daring and it was not easy, but I trust this is going to help me in my college classes and I think that is a great advantage. Calculus has been one of my favorite areas of Mathematics, besides algebra and trigonometry, and the fact that integrals also include these topics that I like, makes it even more interesting.
