dizziness fast, slow, pounding, or irregular heartbeat or pulse headache irritability mood changes noisy, rattling breathing numbness or tingling in the arms or legs pounding in the ears shortness of breath swelling of the fingers, hands, feet, or lower legs trouble thinking, speaking, or walking troubled breathing at rest weight gain Oral steroids (steroid medication taken by mouth) help in many diseases. However, some people who take oral steroids develop side-effects.. Low blood pressure (hypotension) which can cause dizziness, fainting or collapse. If the dose is reduced gradually, the body gradually resumes its natural production of steroids and the withdrawal.

MA. Marvell 30 Aug 2009. It's interesting that you experience dizziness at lower doses of prednisone, and not initially when the dose is high. Yes, prednisone can cause dizziness or a feeling of a whirling motion. This is a common side effect but if it really bothersome then please see your doctor.

The pharmacological treatment of choice for acute vestibular neuritis is oral steroids beginning as soon as possible with gradual tapering of the dose. One third of patients have chronic vestibular symptoms and develop benign paroxysmal positioning vertigo (BPPV). [secret info](#)

The oral steroid patients experienced typical symptoms, such as sleep, mood and appetite changes. The injected steroid patients had pain at the injection site and vertigo; a few had ear infections and a perforated eardrum. Most symptoms cleared up by 6 months. Nevertheless, the difference showed that while the treatments were equally effective.

Upset stomach. Weight gain, with fat deposits in your abdomen, your face and the back of your neck. When taking oral corticosteroids longer term, you may experience: Elevated pressure in the eyes (glaucoma) Clouding of the lens in one or both eyes (cataracts) A round face (moon face) High blood sugar, which can trigger or worsen diabetes.

I have known for a long time about the complications and side effects associated with the long-term use of oral steroids (osteoporosis, weight gain, behavior changes, increase in blood pressure, etc.), so the general recommendation has been to take the minimum dose necessary for the shortest amount of time needed to treat the problem; however. Answers. Yes, it is. Dizziness is a common side effect of steroids. Prednisone is a powerful steroid that changes a lot of the ways your body functions, so side effects are very common and can last awhile after being treated. Steroids are stored in the fat cells of your body so it can take some time for them to completely leave your body.

Types & Side Effects of Oral Steroids. Indeed! Steroids make you feel tired. Excessive use of any steroids causes harmful impacts on your body. When steroids taken for short duration of time, it has literally minute impact on your body but when you overdose it, outcomes can be terrific. Steroids like prednisone are major source of tiredness.
