

Conclusion on Calculus II

Around November of last semester, I decided to do my major on Economics. Nevertheless, I decided to take Calculus II, even though most of the people told me it had nothing to do with my career.

In my personal opinion I couldn't have made a better decision because throughout the semester I always had the constant idea that I was challenging myself. The program had activities with written problems in which students were supposed to evaluate information and analyze implicit data in order to assign values for variables. For this reason, I think all of us developed critical thinking and time management since this course required commitment, responsibility and patience at any kind.

The truth is that I've never been more happier about a course and I think it has a lot to do with the relationship people have with teachers and classmates and learning methods applied inside the classroom. In other words, I really liked that we were given plenty of time between practices or quizzes to solve doubts, our teacher was always willing to solve questions in the best way possible and never made us feel ignorants or stupid.

I wouldn't change anything about this class, not even my lower grades because those taught me of what mistakes are important to avoid in the future and that every success comes along with effort and dedication.
